

Reef communities from the Devonian:

Devonian reef communities and its correlation via microfossils and geochemistry is researching by Thomas Suttner of the University of Graz. Research work in the Carnic Alps since 2004. Main topic during 2004-2006 concerned the biostratigraphic age of the Lower Devonian sequence of Mount Seewarte (Figure 1), Wolayer Area (Suttner 2007).

Since 2006 this topic changed to the investigation of Lower-Middle Devonian reef communities from the shallow marine sequence of the Carnic Alps (Hubmann & Suttner 2007). In collaboration with Bernhard Hubmann (University of Graz) a project (NAP0001: 2007-2009) was established to investigate the effects of Mid-Devonian global extinction events on the reef related flora & fauna (First results are presented in Berichte der Geologischen Bundesanstalt 79).
